

Setting

The general theme section allows you to control the behaviour and the overall appearance of your theme.

To configure this part go to Extensions->Template->Waxom->Options->Styles

Styles

The style section contains the customizer.

Click [Customizer](#) to create your own style for the whole site or individual pages. You can pick colors, modify sizes and much more with a real time theme preview. Choose the style to be loaded in the layout options.

Click **Copy** and enter a new name to duplicate the style. Then you choose your new style from the list and can make adjustments.

GET STARTED

To get more capabilities use “Advanced Model”. After all the changes, click Save.

Development

Always uncheck following options for your production website.

- ☐ Compile LESS in the browser on every page load.
- ☒ Allow styles to be loaded by URL. This will override the style originally loaded by the theme.

Compile LESS

Note Compiling LESS will replace all related CSS files. All styles will be compiled at once.

Setting	Description
Compile LESS in the browser on every page load	Check the first option and the browser automatically compiles your LESS files via JavaScript every time you load a page. This provides an appropriate testing environment. It's not recommended to enable developer mode on the live site as the constant process of compiling is highly inefficient.
Allow styles to be loaded by URL. This will override the style originally loaded by the theme.	The option enables the browser to load styles by URL. This is useful, if you want to test different styles for your website. Disable this option, when your website goes live.

To finish your LESS modifications, hit the **Compile LESS** button and all your changes will be compiled into the final CSS.

Make sure, you aren't developing in the /styles/STYLE-NAME/css folders, because these folders will be overridden as soon as you hit the **Compile LESS** button.

Compression

To optimize page load time, choose one of the following compression options.

Minify CSS and JavaScript into a single file. Use gzip compression and Data URIs to reduce image file requests.

Minify + Data URIs

Setting	Description
None	All files will be loaded separately and fully sized.
Combination + Minify	This option will minimize and combine CSS and JavaScript files into one single file.
Combination + Minify + Data URIs	Data URI embeds image data directly into the document, thus reducing the HTTP requests for your image files. This applies only to images that have a maximum size of 10kB.

Combination + Minify + Data URIs + Gzip	Gzip allows a faster data transfer through compressed data packages, instead of dealing with large data volumes by sending them separately
---	--

Responsive

The viewport meta tag controls the layout on mobile browsers. If it's not set, the default width on mobile is 980px and the site will look the same like on desktops.

☒ Disable the viewport meta tag.

Bootstrap

If you just use the Joomla blog and articles you don't need to load Bootstrap.

☐ Disable Bootstrap.

Content

Display specific content elements in the theme.

☒ Hide To-top scroller.

☒ Hide Warp branding.

Social Button

Display Tweet, Google+ or Like buttons in your posts to share them in social media.

☐ Show Tweet button.

☐ Show Google+ button.

☐ Show Facebook Like button.

Modules

Modules in positions can be displayed in different styles.

Choose the default module style for each position.

Position	Style
top-a	<div>Blank▼</div>
top-b	<div>Blank▼</div>
top-c	<div>Blank▼</div>
top-d	<div>Blank▼</div>
top-e	<div>Blank▼</div>

Additional scripts

Insert your Google Analytics tracking code or any other additional scripts here. They will be added before the closing body tag in the theme.
